

ELECTRODYNAMICS
FYS3120: PROBLEM SET 11

SEBASTIAN G. WINTHER-LARSEN

1. SIMPLE LAGRANGIAN DYNAMICS

A non-relativistic particle, with electric charge q and mass m moves in a magnetic dipole field, given by the vector potential

$$(1) \quad \vec{\mathbf{A}} = \frac{\mu_0}{4\pi r^3}(\vec{\mu} \times \vec{\mathbf{r}}),$$

where $\vec{\mu}$ is the magnetic dipole moment of a static charge distribution centered at the origin.

1.a. **Lagrangian.** The Lagrangian is given by

$$(2) \quad L = T + q\vec{\mathbf{v}} \cdot \vec{\mathbf{A}}.$$

The kinetic energy is simply $T = \frac{1}{2}m\vec{\mathbf{v}}^2$ while the potential is

$$q\vec{\mathbf{v}} \cdot \vec{\mathbf{A}} = \frac{q\mu_0}{4\pi r^3}\vec{\mathbf{v}}(\vec{\mu} \times \vec{\mathbf{r}})$$
